

# Improving Knowledge Graph Embeddings through Contrastive Learning with Negative Statements

Rita T. Sousa, Heiko Paulheim

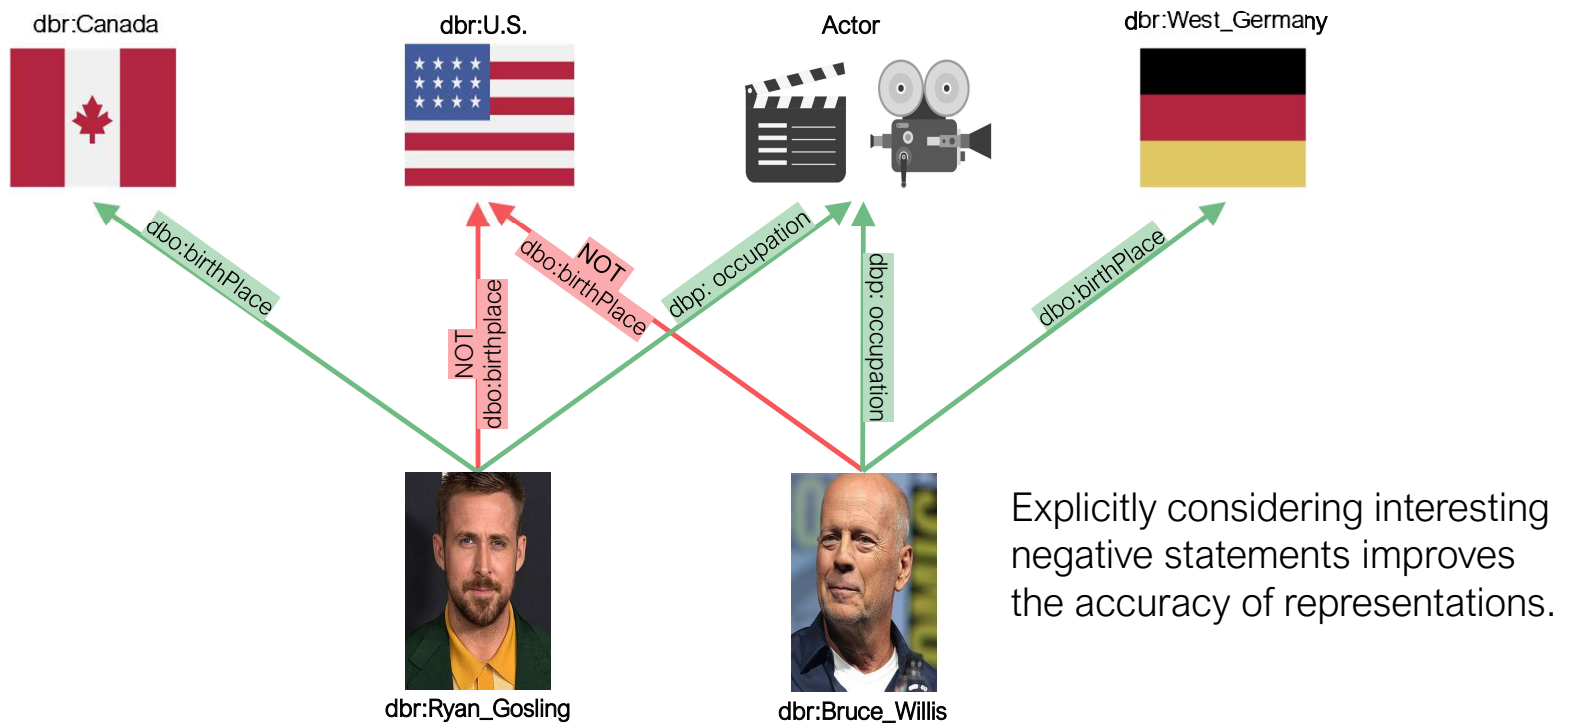

International Conference on Knowledge Capture (K-CAP)  
December 10, 2025

The vast majority of knowledge graph (KG) relations are defined as positive statements.

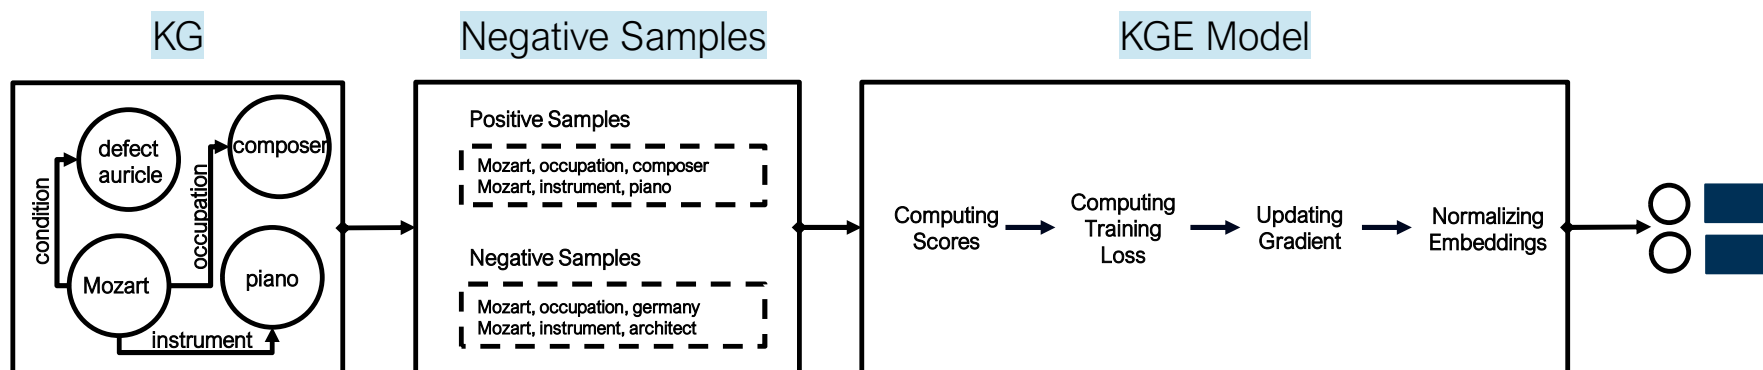

However, negative statements can be defined.

However, little attention has been given to the exploration of negative statements by KG embedding (KGE) approaches.

# Training KGE models

Typically involves corrupting true triples by randomly replacing their head or tail entity with another entity from the KG.

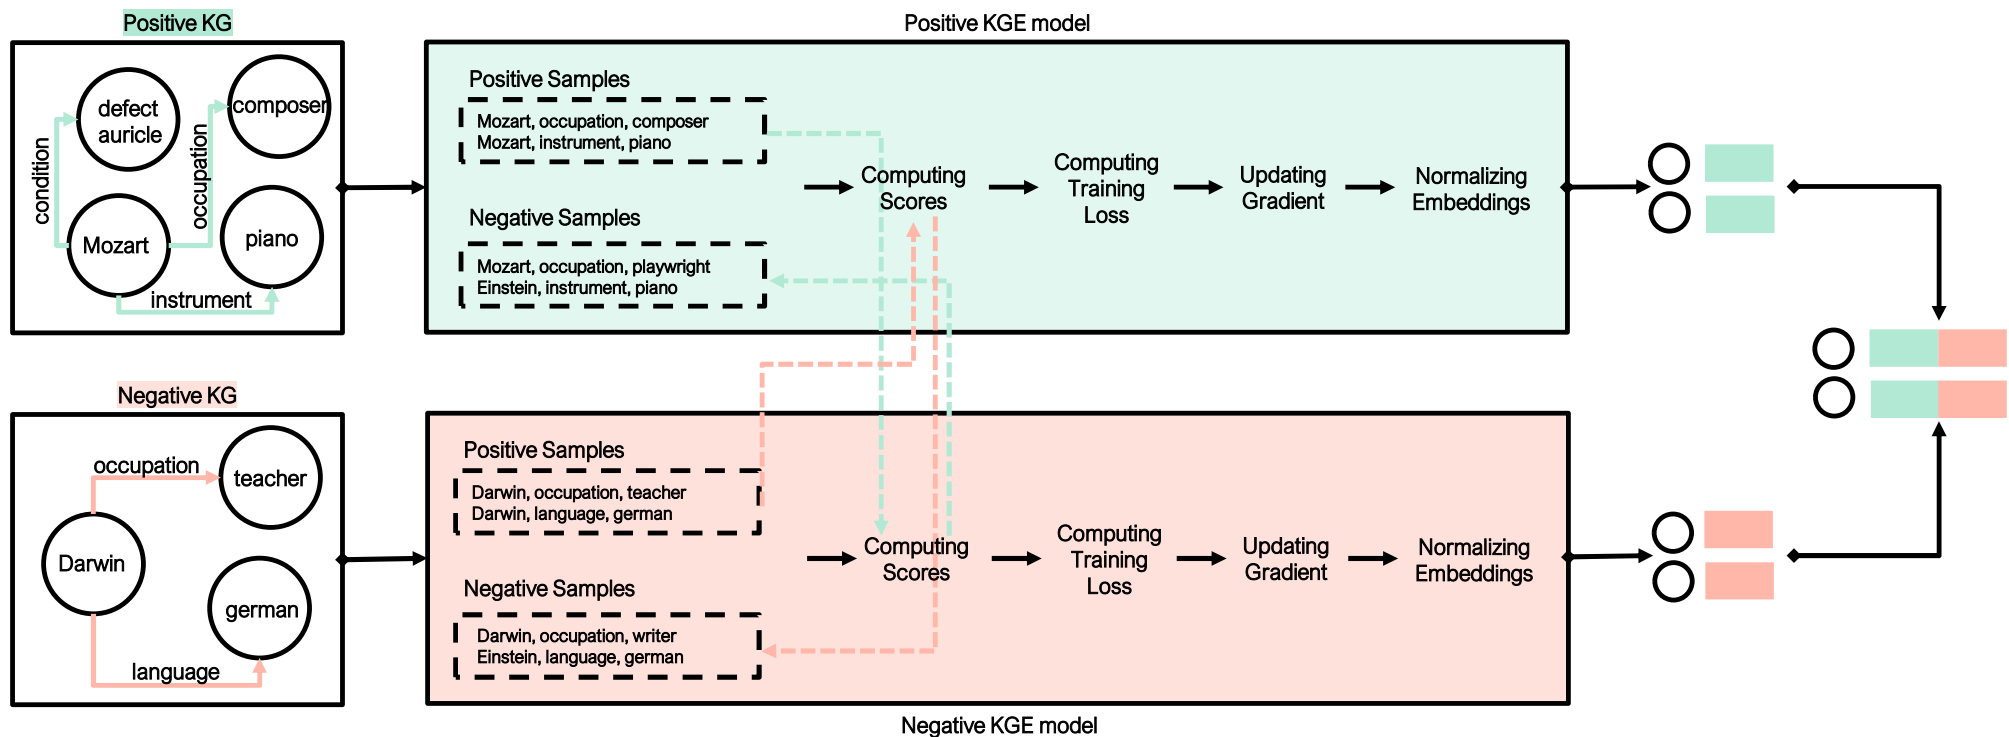

The goal is to assign higher scores to positive samples and lower scores to negative samples.

KGs are built under the Open World Assumption, while KGE models adopt the Closed World Assumption or Local Closed World assumption.

# Methodology

It is **KGE-agnostic** and can be integrated into any KGE model that defines a scoring function and employs negative sampling during training.

# Methodology

## Building the Positive and Negative KG

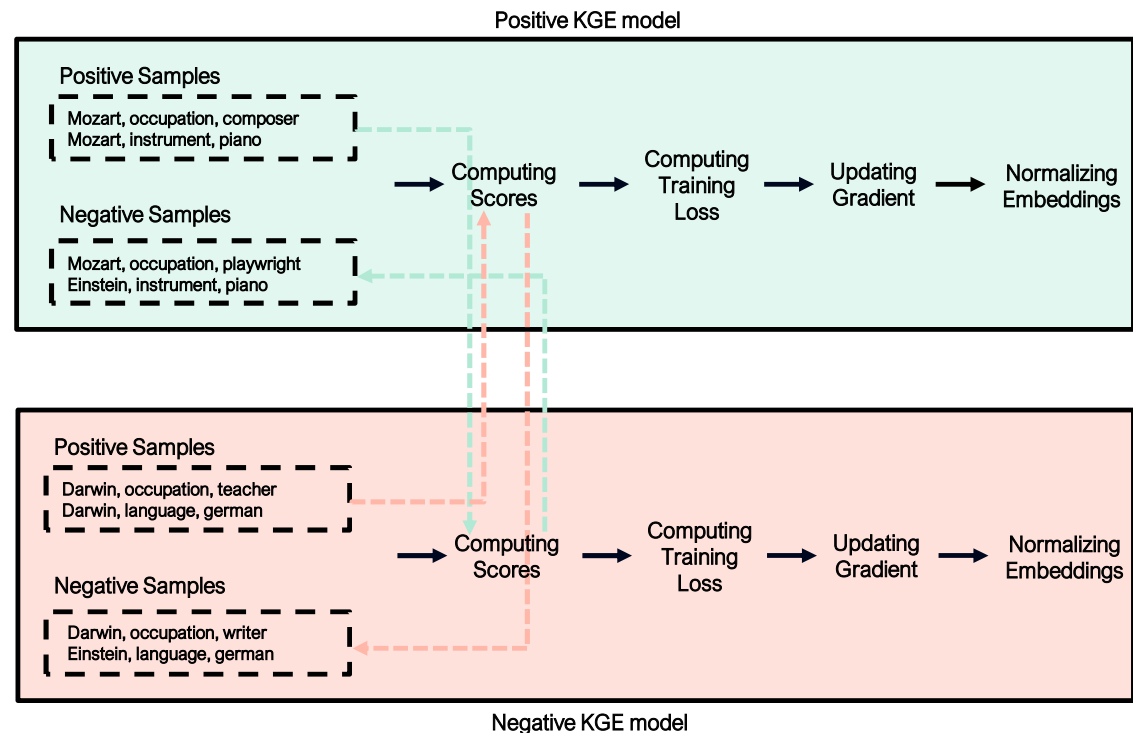

- Two separate RDF graphs are built: one from positive statements and another from explicitly defined negative statements.
- When the KG is backed by an ontology, the transformation follows the OWL to RDF Graph Mapping guidelines defined by W3C.

# Methodology

## Initializing KGE models & Contrastive Learning for Generating Negative Samples

Two-stage approach to negative sampling:

1. In the initial phase, the standard random corruption is used.
2. After *cl\_phase* epochs a contrastive learning-based strategy is used.

The contrastive learning strategy enables the dynamic generation of negative samples that are more meaningful and challenging as training progresses.

# Methodology

## Generating the Final Representation

- Each node and relation in the KG is associated with two distinct representations: one learned from positive statements, and another learned from negative statements.
- To construct the final entity representation, the two embeddings using vector concatenation.

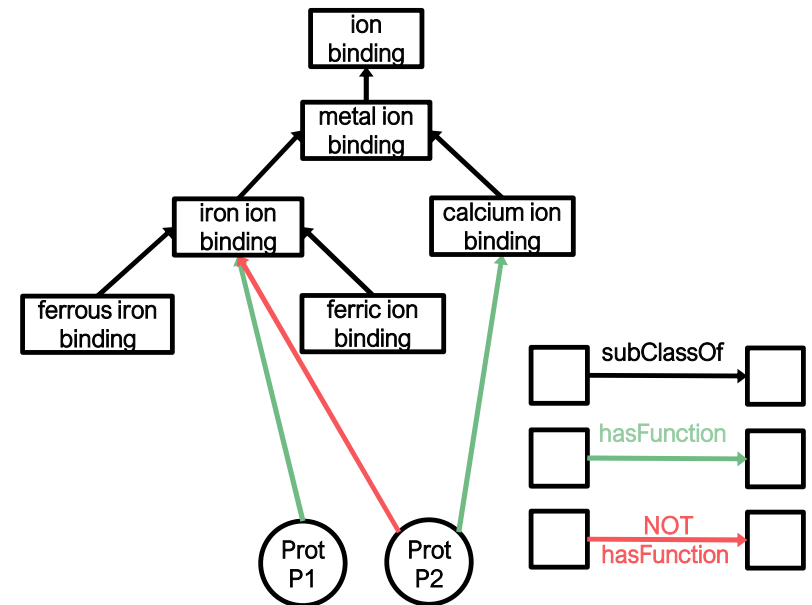

# Evaluation Data

Wikidata KG

Gene Ontology (GO) KG

# Evaluation Data

## Wikidata KG

**Positive Statements:** Wikidata is a vast collection of statements describing millions of entities.

**Negative Statements:** A statistical inference method called peer-based inference[1] is used.

**Task:** Link prediction.

[1] Hiba Arnaout, Simon Razniewski, Gerhard Weikum, and Jeff Z. Pan. 2021. Negative knowledge for open-world wikidata. In The Web Conference. 544–551.

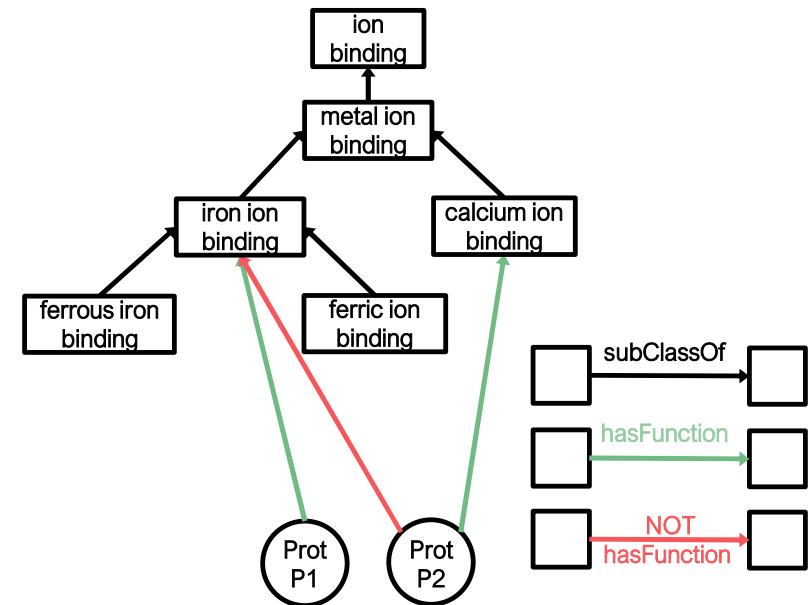

# Evaluation Data

**Positive Statements:** GO KG integrates both the GO itself and the GO annotation.

**Negative Statements:** The phylogenetic trees reveal where functions are lost over time[2] and can be recorded negative annotations.

**Task:** Triple classification.

## Gene Ontology (GO) KG

# Evaluation

## Set-up & Baselines

### 3 KGE models

KGE	Scoring Function
TransE	$f(h, r, t) = - \ h + r - t\ _p$
DistMult	$f(h, r, t) = \sum_i h_i \cdot r_i \cdot t_i$
Complex	$f(h, r, t) = \text{Re} \left( \sum_i h_i \cdot r_i \cdot t_i \right)$

### 2 variations of the proposed approach

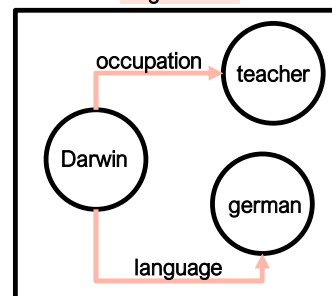

### Baselines

(use embeddings with twice the dimensionality)

#### Positive KG

#### Negative KG

# Results

Report **performance results** for link prediction on Wikidata and triple classification on GO KG.

The quality of the embeddings on both KGs by applying **clustering metrics**.

**Ablation studies** to analyze the impact of *cl\_phase* and embedding size.

# Results

## Link Prediction on Wikidata

Inferring a missing entity in a triple, such as predicting the head entity or the tail entity.

Any corrupted triples that appear in the training set are excluded.

KGE Model		MRR	Hits@10	Hits@1
TransE	pos	10.06%	18.20%	<b>5.52%</b>
	neg	9.34%	17.28%	5.08%
	ours (pos)	10.15%	18.56%	<b>5.52%</b>
	ours (pos-concat-neg)	<b>10.40%</b>	<b>19.32%</b>	5.36%
DistMult	pos	6.86%	12.64%	3.76%
	neg	4.05%	7.48%	2.24%
	ours (pos)	7.90%	17.52%	3.40%
	ours (pos-concat-neg)	<b>9.63%</b>	<b>20.56%</b>	<b>4.64%</b>
ComplEx	pos	4.66%	10.32%	1.84%
	neg	4.77%	8.60%	2.96%
	ours (pos)	8.86%	19.12%	4.16%
	ours (pos-concat-neg)	<b>10.07%</b>	<b>20.80%</b>	<b>4.84%</b>

- Our approach consistently outperforms the baselines for MRR and Hits@10.
- Using the negative KG yields competitive results.

# Results

## Triple Classification on Gene Ontology

The relation between two proteins is predicted as a **binary classification** task by combining their embeddings with the Hadamard product and training a Random Forest using 5-fold CV.

KGE Model		Pr	Re	F1	AUC
TransE	pos	58.85%	58.68%	58.51%	62.80%
	neg	64.07%	64.06%	64.05%	68.49%
	ours (pos)	60.98%	60.98%	60.97%	64.74%
	ours (pos-concat-neg)	<b>67.34%</b>	<b>67.32%</b>	<b>67.31%</b>	<b>74.13%</b>
DistMult	pos	81.67%	81.66%	81.66%	88.91%
	neg	<b>83.70%</b>	<b>82.89%</b>	<b>82.78%</b>	90.58%
	ours (pos)	77.27%	77.07%	77.03%	86.03%
	ours (pos-concat-neg)	83.03%	82.68%	82.64%	<b>90.93%</b>
ComplEx	pos	79.34%	79.02%	78.94%	86.70%
	neg	81.45%	80.20%	79.99%	87.93%
	ours (pos)	78.97%	78.97%	78.97%	87.54%
	ours (pos-concat-neg)	<b>81.91%</b>	<b>81.91%</b>	<b>81.91%</b>	<b>89.55%</b>

- Except for DistMult, it leads to **improvements** across all performance metrics.
- Weaker KGE models, such as TransE, benefit the most from our approach.

# Results

## Embeddings Evaluation using Clustering Metrics

Provides a proxy for how well the representations reflect underlying semantic distinctions.

Wikidata (21 frequent types)

Gene Ontology (2 types)

- Our approach demonstrates superior clustering performance.
- For Wikidata KG, the baseline for negative KG outperforms the baseline for positive KG, likely due to differing relation distributions across entity types.

# Results

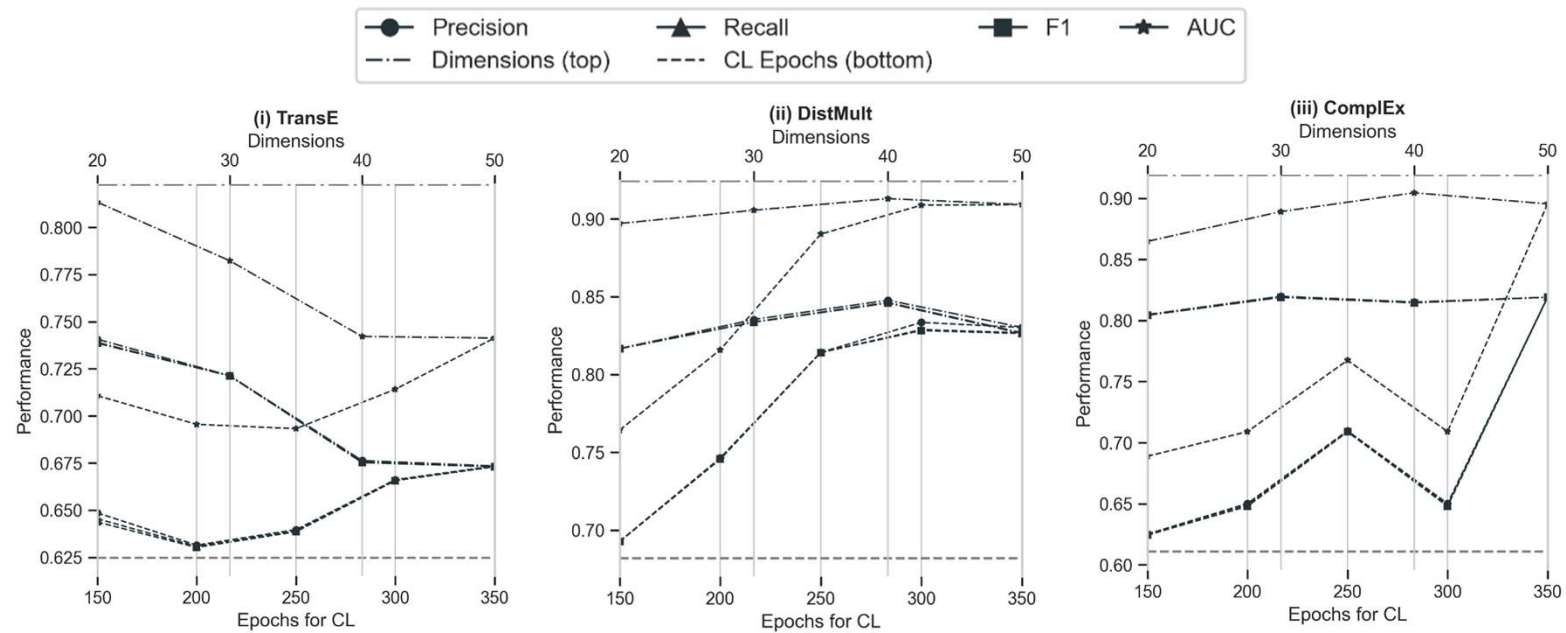

## Ablation Studies for Wikidata

- Delaying the transition to the contrastive learning strategy appears to be beneficial.
- Our approach demonstrates robustness across different embedding sizes.

# Results

## Ablation Studies for Gene Ontology

- Delaying the transition to the contrastive learning strategy appears to be beneficial.
- Our approach demonstrates robustness across different embedding sizes.

# Conclusions

- Current KGE models cannot effectively handle explicitly defined negative statements.
- Our approach combines dual-model training with an adapted negative sampling mechanism grounded in contrastive learning.
- Our approach outperforms state-of-the-art KGE models on two KGs and tasks.
- Our approach can be easily incorporated into any scoring-based KGE model for any KG and task.

# Future Work

Efficient strategy to generate candidate negative samples in contrastive learning.

Systematic hyperparameter optimization.

Implementation of an asynchronous contrastive training strategy.

# Additional Results

## Link Prediction on Wikidata

Semantic awareness,  $\text{sem}@k$ , measures the proportion of triples that the predicted entity (head or tail) belongs to the same type as the corresponding entity in the ground-truth triple.

KGE Model	Head	Tail	Average
TransE	pos	53.12%	62.48%
	neg	20.96%	58.72%
	ours (pos)	63.36%	57.84%
	ours (pos-concat-neg)	60.60%	57.72%
DistMult	pos	53.04%	62.40%
	neg	62.16%	40.00%
	ours (pos)	25.28%	46.64%
	ours (pos-concat-neg)	59.16%	71.84%
ComplEx	pos	74.40%	58.96%
	neg	76.72%	34.08%
	ours (pos)	37.44%	63.20%
	ours (pos-concat-neg)	59.72%	74.88%

- Our approach not only improves ranking metrics but also leads to more semantically plausible predictions.
